1. Operation description of the device

Modulating control actuators DM-…-1./MB/… series are used to open and close air dampers in heating and air-conditioning systems. These actuators are used to control air dampers of different sizes. Control of actuators of this series is carried out either by current or voltage signal or by communication interface in BacNet MS-TP protocol (default communication speed 9600 bps). Actuators have a changing direction of rotation switch and operating mode switch.

BACnet Objects list:

BacNet Address	Default Name	Description	R/W
		Analog Input Objects	
0	Analog_Input	The state of analog control input. Present_Value can be overwritten with a value between 0 and 10. If there is no overwriting within 60 seconds, Present_Value will return to the value from the physical analog input. The object exists only for modulated actuators (analog controlled).	R/W
